

## Practice Set -2

```
#76 is an Automorphic Number => Since 5776 ends with 76
#153 is an Armstrong Number =>  $1^3 + 5^3 + 3^3 = 1 + 125 + 27 = 153$ 
#Number: 987 => Sum of digits of 987 = 24
#A number is Spy if: Sum = Product
# Sum =  $1 + 2 + 3 = 6$ 
#Product =  $1 \times 2 \times 3 = 6$ 

#Write a Python program to check whether a given number is Automorphic or not.
#Count total Spy numbers in a given range.
#Print numbers from 1-100 where sum of digit equals 7.
#Check if a given number is Armstrong or not.
#Print all Armstrong numbers from 1 to N.
#Find sum of digits of a given number.
#Print all Automorphic numbers from 1 to 10,000.
```

First complete the program given in the image, then start working on the tasks below.

Given a number, count how many digits are even and how many are odd using a while loop.

Write a program that prints the Fibonacci sequence up to N using a loop without recursion.

Write a menu-driven program that performs string operations like reverse, uppercase, count digits, etc.

Write a program that simulates ATM operations using while loop and conditional statements (balance check, withdraw, deposit, exit).
